

CloudWalk Technical Challenge

Approach & Methodology

1. Approach

The analysis was conducted following a structured, business-oriented workflow rather than focusing only on descriptive metrics. **Data preparation** Reviewed the dataset structure, columns, and recruitment stages. Formatted the dataset as an Excel table to improve filtering and analysis. Validated duplicate candidate names using Excel conditional formatting. **Exploratory analysis** Built the overall recruitment funnel. Segmented the funnel by role to determine whether bottlenecks were process-wide or role-specific. Analyzed source performance, recruiter performance, candidate signals, response time, and rejection reasons. Reviewed qualitative recruiter notes to identify recurring patterns.

2. Decisions Made

During the analysis, several decisions were intentionally made to improve reliability and avoid misleading conclusions. Treated findings as **associations rather than causality**. Avoided ranking recruiter performance without considering portfolio complexity. Questioned potential **data leakage** after identifying assessment scores for candidates who had not reached those stages. Added a role-level funnel analysis because overall funnel metrics could hide role-specific behaviors. Converted the analysis into executive recommendations focused on business actions instead of only reporting metrics.

3. Use of AI

AI was used as an analytical copilot throughout the project, supporting both productivity and critical thinking. Helped structure the analysis framework and prioritize business questions. Generated hypotheses that were validated against the dataset. Organized unstructured recruiter notes into qualitative insights. Supported the role-level funnel analysis. Reviewed conclusions to ensure consistency between insights and available data. Assisted in translating technical findings into executive recommendations. AI accelerated the analytical process while keeping all conclusions grounded in the dataset.

4. Key Insights

Recruitment Funnel The recruitment process performs consistently during the early stages. The largest opportunity for improvement is the **Technical Test** → **Offer** conversion, observed across all

analyzed roles. **Candidate Engagement No Response** is the most common rejection reason, indicating opportunities to improve sourcing outreach and follow-up strategies. **Sourcing** GitHub and Inbound presented the highest hiring conversion rates. Source effectiveness should also be evaluated by role and seniority before reallocating investment. **Data Quality** Missing rejection reasons and potential assessment-score leakage reduce analytical reliability. **Future Opportunities** AI can support personalized candidate nurturing, automated follow-ups, and recruiter decision support, allowing recruiters to focus on higher-value interactions.
